

Anomalous Traffic Report

Summary

- Two consecutive GET requests to <https://api.devlooper.in/blog> received no response (status code 0). This may indicate server crashes, network drops, or firewall interference.
- Two GET requests for static assets (**ps5.png** and **buds.png**) returned **404 Not Found**, suggesting broken references or potential probing for known files.
- Two POST requests to <https://mozilla-ohttp.fastly-edge.com/> (an Oblivious HTTP endpoint) contained empty bodies, an unusual pattern that could indicate misuse or testing of privacy-preserving services.
- A GET request to **Google autocomplete** with an empty query string was observed, which can be used for fingerprinting or covert signaling.

Detailed Findings

- **Request IDs 265 & 264**
 - Method: GET
 - URL: `https://api.devlooper.in/blog`
 - Status: *No response (0)*
 - **Why notable:** No response suggests possible server error, network drop, or security device interference.
- **Request IDs 271 & 270**
 - Method: GET
 - URLs:
 - `https://devlooper.in/static/images/ps5.png?v=d333ccdf8719`
 - `https://devlooper.in/static/images/buds.png?v=d333ccdf8719`
 - Status: **404 Not Found**
 - **Why notable:** Missing static assets may expose site structure; could also be probing attempts.
- **Request IDs 272 & 262**
 - Method: POST
 - URL: `https://mozilla-ohttp.fastly-edge.com/`
 - Status: **200 OK**
 - Body: *empty*
 - **Why notable:** POST to an OHTTP endpoint is uncommon; empty payload suggests misuse or testing.
- **Request ID 263**
 - Method: GET
 - URL: `https://www.google.com/complete/search?client=firefox&channel=ftr&q=`
 - Status: **200 OK**
 - **Why notable:** Empty query to autocomplete may be used for fingerprinting or covert channel signaling.

Recommendations

- **Investigate missing responses** for /blog:
 - Check server logs for crashes or errors at the timestamps.
 - Review firewall/WAF rules that might drop responses.
- **Validate static assets:**
 - Perform an asset inventory to confirm whether ps5.png and buds.png should exist.
 - Remove or update broken references in HTML/JS.
- **Assess OHTTP POST usage:**
 - Identify the client (script, browser extension) generating these calls.
 - If unauthorized, block the source or enforce CSP rules.
- **Mitigate empty autocomplete queries:**
 - Confirm if any internal code is generating these requests.
 - Consider adding a Content-Security-Policy that restricts outbound requests to google.com unless required.
